Comparative structure analysis of Adenylate Kinase

```
library(ggplot2)
```

```
# Install packages in the R console NOT your Rmd/Quarto file

#install.packages("bio3d")
#install.packages("devtools")
#install.packages("BiocManager")

#BiocManager::install("msa")
#devtools::install_bitbucket("Grantlab/bio3d-view")
```

Q10. Which of the packages above is found only on BioConductor and not CRAN?

BiocManager::install("msa") we know this becasue it says BioManager

Q11. Which of the above packages is not found on BioConductor or CRAN?:

devtools::install_bitbucket("Grantlab/bio3d-view") and we know that becasue it has a separate install command

Q12. True or False? Functions from the devtools package can be used to install packages from GitHub and BitBucket?

True

Align and superpose structures

Next we will use the pdbaln() function to align and also optionally fit the identified PDB structures.

```
# Align releated PDBs
pdbs <- pdbaln(files, fit = TRUE, exefile="msa")</pre>
```

```

Call:
  pdbaln(files = files, fit = TRUE, exefile = "msa")
Class:
  pdbs, fasta
Alignment dimensions:
  13 sequence rows; 227 position columns (204 non-gap, 23 gap)
+ attr: xyz, resno, b, chain, id, ali, resid, sse, call
we can look at the alignments ourselves just by writing pdbs, but thats not really that useful becaue my
eyes arent good at interpreting big data like this
we can plot our sequence allignment like this:
 # Vector containing PDB codes for figure axis
 ids <- basename.pdb(pdbs$id)</pre>
 # Draw schematic alignment
 plot(pdbs, labels=ids)
```

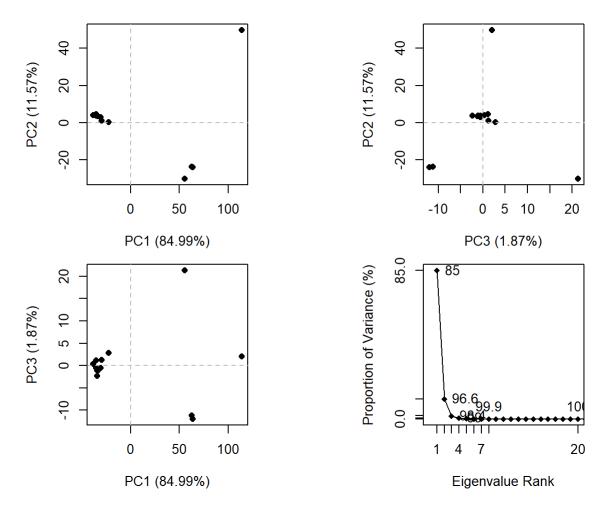

Sequence Alignment Overview

Now we have all this data we have downloaded and organized, we should perform some analysis on it, lets do a PCA

```
# Perform PCA

pc.xray <- pca(pdbs)
plot(pc.xray)</pre>
```

This plot shows the results on PCA analysis on Adenylate kinase x-ray structures. Each dot represents one possible PCA.

We can cluster the structures by RMSD

```
rmsd(pdbs)
```

Warning in rmsd(pdbs): No indices provided, using the 204 non NA positions

This Plot shows that all the possible PCA analysis results come in to 3 main groups.

Further Investigation

To visualize the major structural variations in the ensemble the function mktrj() can be used to generate a trajectory PDB file by interpolating along a give PC (eigenvector):

```
# Visualize first principal component
pc1 <- mktrj(pc.xray, pc=1, file="pc_1.pdb")
pc1</pre>
```

```

```

Now that I have my pc_1.pdb file I can open this file, pc_1.pdb, in Mol*. In a in web browser page visit https://molstar.org/viewer/ and "Open Files" from the left control panel selecting.
